

# ClearNail Laser®

a Breakthrough in Fungal Nail Treatment

## FUNGAL NAIL DISEASE

Fungal nail diseases (Onychomycosis) affects up to 14% of the population. Fungi that feed on keratin, a structural protein within your nails, often causes this condition. The disease may result in pain, is contagious and results in a negative self-image.

## IS THE PROCEDURE PAINFUL?

During the laser treatment, the laser will be slowly moved across the nail bed. The laser beam will generate heat beneath the nail and within the underlying fungal colony. You will feel a warm, but tolerable sensation during the procedure. As the laser has no effect on healthy tissue, there are no recorded side effects.

## HOW SOON WILL I HAVE CLEAR NAILS?

Results are not immediate, but rather as the nail grows you will notice new, healthy growth from the nail base (epynichium). Nails grow slowly so a complete result is observed months following the procedure.

**Laser treatment is fast, safe, painless and is extremely effective with NO side effects.**

## WHAT ELSE TO I NEED TO KNOW?

- The procedure is safe
- No anesthesia is required
- There are no side effects
- There is no visible harm to the treated nail or adjacent skin
- Socks and shoes can be worn immediately after the procedure
- Nail polish can be applied after treatment
- There is no "recovery" period after the procedure
- You are able to comfortably walk out of the clinic following the procedure
- Your Podiatrist will recommend a post treatment sanitisation program to prevent any cross infection
