The mower is a machine for cutting grass or other plants growing in soil. Usually, characterized by cutting and harvesting, using similar tools, but is a term for traditional crops grain crop, for example, with the harvester and the harvester.

Smaller lawn mower, used in sports stadiums (stadia) is called the mower or grounds mower, which are often subjective, or it can be small enough to be paid by the operator. The reasons for their reel mowers or rotary cutting. Mainly used more lawn mowers or conditioners to cut the grass (or other crops) for silage or hay and put it in many cases, material reduction in the ranks, which is known as spinnerets. Rakes are also used (or cutter) to cut the grass and crops (cereals). Before the invention and adoption of mechanical harvesters, (and today in places mower use is impractical or uneconomical), cut the grass and grain crops by hand with machetes or sickles.

And usually larger mowers engage (equipped with a series or a band of a similar reduction unit), so that can be individually adapted to the contours of the earth. It can be powered and developed by animal or tractor draft. Units can be mounted under the tractor reduction between the front and rear wheels mounted on the rear, without obstructions or three points behind the tractor and trailer towing. There is also a dedicated self-propelled cutting machines, which often mounted mower units at the front and sides for easy viewing by the driver. They boom mowers, side arm long hydraulic arms, like the arm of Lauder, which allows the tractor to mow steep banks or around objects while remaining on the surface safer.

[Edit] Types of mower

Mechanism may be a mower cutting in one of several different designs:

[Edit] sickle mower

Eicher Tractor with mower bar mounted on the middle finger

Sickle mowers, also called alternative cutters, cutters cutter bar or bars of the fingers, has a. Long (six to seven feet and a half usually) on the bar are held with the fingers guardplates set in a channel in the sickle-bar exchanges with some very sharp sickle sections (triangular leaves). This is the reason behind sickle bar back and forth along the channel. He is cutting the grass, or other plant material, and the sharp edges of the sickle sections and plates with your fingers (and this work can be compared with the electric hair cut).

And bar riding on the floor, supported on a slide on the end of the inner and can be tilted to adjust the height of the pieces. Board to spring into the outer rod end directed cut hay cut hay. The channel is formed between the parts and materials are polished, and allows the mower skid to ride in the channel and mow the lawn just a clean cut in the next patch. These were the first successful horse-drawn mowers on farms and the general principles that guide the design remains modern mowers.

[Edit] mower

Rotary cutters mounted on the rake

Rotary mowers, also known as drum mowers and has a rapidly rotating bar, or disks mounted on the bar, with sharp edges that cut the crop. When these are mounted on tractor mower can easily cut the grass at a maximum of 20 mph (32 km / h) in good condition. Some models are designed to be mounted in groups of two and three times on the tractor, one front and one at each side, and therefore able to reduce up to 20 feet (6 meters) of the areas.

In the circumstances of pieces of raw leaves and became attached to the discs to absorb shock from obstructions. Often it is rear-mounted units, and in some countries called the bushes cut. The use of self-cutting this type of resistant grass in parks and conservation lands.

[Edit] lawnmower

Reel mower

Reel mower, also known as cylinder mowers (family, such as a cylinder mower or a self-powered hand-), and has a horizontally rotating cylindrical reel composed of helical blades, each in turn passes through a cutter horizontal bar, scissors and the production of a continuous work. Held at the bar on the adjustable level just above the soil surface and quickly reel works depends on the speed of forward movement of the device, driven by the wheels running on the floor (or self-propelled a motor applications). And cutting the grass may be collected in a container.

Using this type of lawnmower to consistently produce short and even the bowling greens and golf lawns, gardens and sports. When pulled by a tractor (or previously by the horse), and rounded in many cases, these mowers in groups of five or three or more, to form a band cutter. A well designed mower mowing high and very complex and dense, but this type works best in vegetation, a little short vertically, and because the plant tends to be rolled flat instead of cut.

[Edit] crusher

Flail mower

Mowers have a small number of pens at the end of chains attached to the horizontal axis. And it is in several sections of the axis of the Heads of like hitting the grass quickly. These types are used in rough terrain, which can often be blocked by the feathers of other objects, or stricter vegetation of grasses, and brush (scrub). Due to the length of the strings and the high weight of the blades, which are the best in the cut brush bulk of the mower other, due to the relatively high inertia of the blades. May in some types of materials collected in a container pieces. As mower pen (see above) may be the use of bulk mower in an upright position for trimming both sides of the cover when it is often called a coverage conclusive.
