Municipal & Domestic Work - Soda Blasting

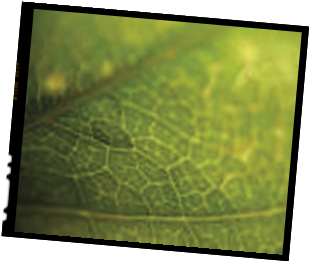

Enviro Blast Australia can offer a vast number of inexpensive substitutions to degreasing, chemical cleaning, chemical coatings removal, restoration and protection.

Soda Blasting has a wide range of specialised applications.

From removing burnt on carbon from pots and pans to removing concrete from glass. From restoring engine and hydraulic parts, to crack detection on large ships and structures. From wood and antique furniture restoration, to council domestic graffiti and bitumen removal. From glue and chewing gum removal, to main roads line marking removal. From paint removal on cars, to delicate aviation applications and anti-foul and gel coat removal on boats.

Soda blasting can be applied to numerous surfaces. These include glass, aluminium, stainless steel, wood, brick, steel, concrete and natural stone (sandstone, lime, marble) to name a few. Soda blasting causes very minimal or no damage to the surface.

In certain cases we are able to do selective paint layer removal taking only top coats off while leaving the undercoat in tact. We are even able to remove paint from an aluminium soft drink can without damage to the can. Unlike sandblasting, garnet blasting or bead blasting, Soda blasting creates very minimal or no heat which ensures the shape and strength of the surface being blasted.
