

CBS | COMPLETE BLASTING SOLUTIONS

**Dry ice blasting, high pressure cleaning and
dustless sandblasting services
in and around Sydney**

CBS is a privately owned industrial cleaning company based in Engadine,
just outside Sydney.

CBS has extensive expertise and experience in the removal of surface contaminants,
utilising specialised techniques including dry ice blasting, high pressure cleaning and
dustless sandblasting.

We specialise in fire restoration work and factory deep cleans and we work in the
construction, food and beverage, automotive, oil, electricity, chemicals, packaging,
printing and transport sectors in and around Sydney.

CBS works closely and in partnership with maintenance, operations and
facilities managers as well as site agents. We addresses the initial cleaning
requirements as well as generating ongoing cleaning schedules to ensure that sites
always comply with the requirements of Australian local and
national government legislation.

Dry ice blasting/cleaning

Dry ice blasting has a wide range of applications from fire restoration work to factory deep cleans and is used in the construction, food and beverage, automotive, oil, electricity, chemicals, plastics, ferrous and non ferrous metal casting, packaging, printing, aerospace and rail sectors.

CBS uses the latest cutting edge dry ice blasting equipment to effectively and efficiently clean a wide range of surfaces removing contaminants and achieving the most impressive results on sites in and around Sydney.

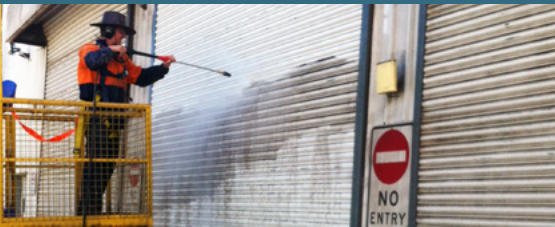

High pressure cleaning

In this cleaning process water is propelled at high velocity at the surfaces to be cleaned.

No matter what the industry, high pressure cleaning is an efficient, cost effective and environmentally friendly part of any industrial plant or equipment cleaning toolkit.

High pressure cleaning is ideal for cleaning concrete, brickwork, floors, factory and warehouse walls and loading bays, skips and has numerous transport applications.

Dustless sandblasting

The dustless sandblasting process works by mixing water and abrasive inside a blast tank and blasting by means of an air tool powered by a large compressor. The introduction of water to the abrasive not only eliminates the dust experienced during a conventional sand or grit blasting process but also increases the force by which the abrasive can be propelled at the surface being treated.

CBS can remove paint/powder coating, road markings, graffiti, concrete/mortar, glues/adhesives, rubber, barnacles and much more.
