

Drill Hole in a Tile

Ceramics, tiles, natural stone

For use with ceramics as well as for granite and marble, we have developed special repair methods, ensuring very good results. Holes and chips on tiles, stone and ceramics can be removed quickly with our Ceramic Filler and that without any drying or curing time. Ceramic Filler is very helpful especially in difficult cases like e.g. for tiles on under floor heating, in showers, with large paving tiles or, at on-site installation, when spare tiles are not available any more.

Step 1

Preparation: The damage area has to be clean, dry and free from grease.

Step 2

Cleaning: Clean the area with a cloth

Step 3

Filling: Use the hot tip of the Hot Knife to apply Ceramic Filler of the matching shade to the damaged area. Always work from light to dark. To match the right shade, different colours can be intermixed. Clean the tip of the heating iron after use.

Step 4

Leveling: Use the Transparent Special Fillers Applicator to strip off excess material. Important: Do not use a metallic tool, as this would create metal abrasion and the filled area would turn dark.

Step 5

Colour corrections can be made by repeating the previous stage (with the desired colour) and again removing any surplus using the Special Fillers Applicator. With even and high-gloss surfaces, fill small pores with transparent filler and again remove excess material with the Special Fillers Applicator.

Step 6

Seal the dry, repaired area with the Brush Pen Clear Lacquer (high-gloss or matt finish). The only exception is for white high-gloss surfaces. These should be sealed with the relevant highgloss Brush Pen Covering Lacquer (colours can be intermixed).

Step 7

Gloss Sheen Adjustment: When the sealed area is dry (after approx. 4 hours at room temperature) a final gloss sheen adjustment can be made with the Sanding & Polishing Cloth. The white side of the cloth reduces the sheen level while the green side polishes.
