

Pavers FAQs

Q: What are the different paver types that I can use?

A: Among the most commonly used pavers are brick, concrete, rubber, and natural stones, such as sandstone, granite, slate, limestone, and travertine.

Q: How do I ensure that my paved surfaces won't move or shift over time?

A: One effective way of keeping your pavers firmly in place is to install a good edging material (called "edge restraint"), such as concrete or metal.

Q: What's the easiest way of installing pavers?

A: The ideal process goes like this: Clear the area of debris and other hazard. Prepare the base material and the sand bedding, and then lay down the pavers carefully according to your desired pattern or theme. Afterwards, sweep sand over the paver joints to fill them up nicely and then apply sealant.
