HOT WATER HEATERS

your local plumber in Penrith, Penrith South, Penrith City, Glenmore Park, Emu Plains, Blue Mountains, St Marys, Leonay, Cranebrook and Western Suburbs.

Electric

Electric storage **water heaters** are ideal for use with money saving off-peak tariffs and are available in a range of sizes to suit most needs. Whether you're a small family on a budget or a larger family with a big demand for hot water, **Up Front Plumbing Services** has the solution that is right for you. A vast range of solutions available – indoor or outdoor, small through to large tanks and the ability to have abundant hot water they are an inexpensive solution to your hot water needs.

Even a small tank that fits under a kitchen bench can heat a lot of hot water in a short time – great for apartments, canteens and town houses.

An **electric hot water system** is a hot water system that uses electricity to heat the hot water for your home or office. **Electric hot water systems** have an electric element that is sparked when a hot water tap is turned on. This electricity warms the water within the system – whether it be a storage system or instantaneous/continuous. In addition to standard **electric hot water** systems, some **solar hot water systems** have an electric booster element to increase the reliability of consistent hot water.

Some homes or offices do not have gas connections. In this case, it may be more practical to select an electric hot water system to suit your needs.

Gas

Gas water heaters have a **gas energy** rating label: the more stars on the label, the more efficient the heater. There are standard and high-efficiency gas storage heaters. High-efficiency models are more expensive to buy, but cheaper and more environmentally friendly to run. Gas storage heaters only need relatively small tanks, as gas is available 24 hours a day and heat losses can be replaced quickly.

Solar

Solar water heaters use the sun's rays to heat your water. They basically consist of solar collector panels and a storage tank. A heat pump works on the same principle as a fridge or air conditioner. It doesn't create heat, but transfers it from the air to your **hot water tank**.
