Why Do Men's and Women's Shirts Button on Different Sides?

You've invariably noticed that while men's shirts have their buttons on the right side, women's shirts have their buttons on the left side. Why is this?

Though there's no historical record or museum with an exhibit devoted to buttons (and/or factual logic as to why a person's sex would have anything to do with said buttons' orientation), most sources seem to cite the same simple rationale that dates back over a century.

Mens' buttons are on the right side because men have always tended to dress themselves and most men (and women, for that matter) are right-handed.

Womens' buttons are on the left side because years ago, during the Victorian Era, the women that could afford fancy clothing with a bunch of buttons would rely on maids to help dress them. So, if a servant (most of whom, naturally, would be right-handed) is going to routinely buttoning up a shirt/dress for someone else, that servant is going to prefer to have the buttons on their right side (which would be the left side of the garment).
