

db7 Capability Statement.

We have helped businesses improve their operations through the provision of quality IT Services since 1989 as professional consultants working for well known IT corporations. We are now providing those same services through a small company with minimal management overheads, and this allows us to be more responsive to clients and more competitive on fees.

As a result of the Financial Crisis many companies and organisations are relying more and more on homegrown talent to support and maintain their IT systems and related process, and for the most part this has been a good solution. However there are times when there aren't enough hours in the day, you feel like you're re-inventing the wheel, you're pushing the boundaries of expertise just a bit too far, or your project will never end. We can help by sharing the load and our expertise with your staff. From our personnel summaries you can see that well known Australian companies have previously used our services on their critical systems, so you can be confident of the quality we provide and that we focus on business benefits not technology.

We provide consultancy, training, project management, implementation, and setup services for:

- Office systems and databases
- Web applications and databases
- Materials Management Processes and systems
- Manufacturing Processes and systems

Some examples of the work we have performed include:

Improved operations through better use of existing IT systems

Provided web hosting, maintenance and support services for corporate web sites

Analysed operations, identified bottlenecks and ways to manage them effectively

Developed management reports to provide a reliable basis for 3 and 12 month planning horizons, allowing managers to move from reactive to pro-active

Developed a materials planning and forecasting process, including the identification of items at risk of stock-outs or oversupply

Review operations to unambiguously map both the current and planned processes, and the changes required

Designed an e-purchasing system that connected buyers and suppliers over the internet.

Analysed equipment usage and identified operational improvements.

Review proposals for new systems against requirements and recommend preferred supplier
